

Worker Recovery & Workforce Management Platform

Product Requirements Document (PRD)

Document Version: 1.0

Date: September 1, 2026

Status: Customer Request – Initial Requirements Capture

Audience: Product & Engineering Teams

1. Executive Summary

This document captures and organizes the customer's requirements for a comprehensive **Worker Recovery System**. The platform will manage remote workers (primarily focused on data annotation / "outlier" style work), handle payroll via Paystack, enforce performance discipline through a warning system, support timesheet logging, enable disputes and feedback, and include a full referral tracking & payout module.

The system aims to provide transparency for workers on expected and actual earnings, managerial oversight with controlled access rights, motivation and accountability through gamification-ready features, and clean data collection across workers, referrers, and partners.

2. Goals & Objectives

Goal	Description
Payroll Transparency	Workers can see expected pay mid-month and receive confirmed payments at month-end via Paystack
Performance Accountability	Formal warning system that escalates to automatic contract termination at 5 warnings
Operational Visibility	Role-based dashboards for Workers, Managers, Referrers, and Admins
Dispute Resolution	Structured process for workers to challenge pay slips
Referral Motivation	Dedicated portal that tracks referrals, earnings generated, and gated payouts
Data Asset Building	Centralized storage of worker, referrer, and partner contact data

3. User Roles & Access Levels

Role	Key Capabilities	Restrictions
Worker	View profile, timesheets, pay slips, earnings; submit feedback & disputes; log hours	Cannot see other workers; cannot see manager feedback
Manager	View assigned workers, issue/revoke warnings, write comments, review disputes, revoke access	Cannot see worker feedback about managers
Referrer	View referrals, status & earnings contribution; request payout (gated)	Cannot request payout until all referred workers are paid
Admin	Full access, upload pay slips, view all feedback, manage roles, process payouts	—
Partner	Contact data stored for future outreach	No full dashboard in v1

4. Core Features

4.1 Worker Profile & Dashboard

Every worker has a personal dashboard displaying work history and performance metrics, daily and cumulative earnings (from logged hours × rate), current warning status (visual yellow dots), upcoming/uploaded pay slip, account balance and payment history, timesheet logging, feedback form, and dispute form. Workers are expected to check their profile at the beginning and/or end of each work day.

4.2 Timesheet Logging

Workers log hours after completing tasks. The platform calculates and displays daily earnings in real time (e.g., \$17/hour rate → worker sees \$17 for one hour). Actual company cost may differ, but the worker-facing view shows the full rate for transparency. Logged hours are a secondary reference; the official pay slip is primary. Large discrepancies can trigger review or dispute.

4.3 Pay Slip & Payment Flow

Mid-month (≈10th–15th): Backend uploads official pay slips. Workers view expected amount for month-end payment.

Month-end (e.g., 30th): Actual payment processed via **Paystack** and credited to the worker's account. Workers track both expected and actual payments in their dashboard.

4.4 Warning & Performance System

Managers issue warnings from a worker's profile. Visual representation uses progressive yellow dots. **Rule:** Five (5) warnings automatically trigger contract termination. Managers can also revoke warnings and leave comments visible to the worker.

4.5 Feedback System

Workers can submit feedback about managers, the work process, or the platform. **Access Control:** Only Admins can view this feedback. Managers must not be able to see or influence feedback about themselves.

4.6 Dispute System

Workers can raise a dispute against a pay slip (e.g., hours worked exceed the amount shown). Disputes are routed to the relevant Manager or Admin for review and resolution. All actions and notes are recorded against the dispute.

4.7 Manager Dashboard

Managers see a filtered view of workers (assigned team, specific format/type, or all). Visible information includes profile summary, warning count/status, open disputes, comments history, and high-level activity indicators. Managers **cannot** see worker-submitted feedback.

4.8 Referral System

Dedicated portal for referrers showing: number of people referred, status of each referred worker's account, earnings/revenue generated by each, total potential commission, and ranking of top-performing referrals.

Payout Gating Rule: A referrer can only request payout when **all** referred workers have received their payments (all status indicators green). If any referred worker is still unpaid, the "Request Payout" button remains disabled. This incentivizes referrers to follow up with unpaid workers.

4.9 Data Collection & Partner Records

All workers, referrers, and partners should have complete records (name, email, phone, country, etc.). Partners / upstream clients do not receive full dashboards in v1. Contact data can initially be managed via Excel import and later fully internalized. Goal: Build a valuable, reusable contact database.

5. Suggested Gamification & Scaling Ideas

- **Achievement Badges** – Perfect attendance, zero warnings for X months, high quality streaks, top earner of the month.
- **Leaderboards** – Weekly/monthly top performers (opt-in or anonymized).
- **Streak Counters** – Consecutive days of logging timesheets or clean performance.
- **Referral Tiers** – Bronze / Silver / Gold levels based on successful referrals or total earnings generated.
- **Early Pay Access** – High-performing workers with zero warnings can request early partial payouts.
- **Quality Score Visibility** – Simple visual score that influences future task assignment priority.
- **Manager Recognition** – Recognition for managers with lowest warning rates or highest team earnings.

6. Non-Functional Requirements

- Strict role-based access control
- Payment integration with **Paystack** for reliable, automated payouts
- Full audit trail for warnings, disputes, pay slip uploads, and payout requests
- Mobile-friendly interface (primary access via phone)
- Secure storage of personal and financial data
- Ability to bulk-import contact lists (Excel/CSV)

7. Out of Scope (v1)

- Full self-service portal for upstream partners/clients
- Automated quality scoring of actual work output
- Real-time task assignment engine
- Advanced analytics / BI dashboards beyond role-specific views

8. Success Metrics (Suggested)

- % of workers who view pay slip before month-end
- Average time to resolve disputes
- Number of warnings issued vs. terminations
- Referral conversion & payout request volume
- Worker retention rate month-over-month
- Completeness of contact data records

9. Next Steps

1. Validate and refine this PRD with stakeholders.
2. Create user stories and acceptance criteria for each feature.
3. Design wireframes for Worker, Manager, and Referrer dashboards.
4. Define Paystack integration scope and sandbox testing plan.
5. Prioritize MVP feature set for first release.

This document is a structured capture of the original customer request. All requirements should be confirmed and prioritized before development begins.
